

Cloudfinder for Salesforce vs. Salesforce Data Export

Salesforce.com recommends that all customers back up their Salesforce.com data. A backup should be generated prior to any data project performed by an organization, including using the import wizards or Data Loader for imports, updates, or deletions.

Cloudfinder for Salesforce

Cloudfinder for Salesforce automatically backs up Salesforce objects and files every day.

With the filtering and search functions it is possible to find and restore any data from within the application. There is also an option to export or download the backed up data as compressed .csv data files.

Cloudfinder for Salesforce includes unlimited retention of current and previous versions of objects and documents.

Salesforce Data Export

An organization can generate backup files of their data on a weekly or monthly basis depending on the Salesforce edition. The backup files can be generated manually once every 6 or 28 days. It is possible to schedule backup files.

The service extracts the organization's data into compressed .csv data files and sends an email confirmation to the administrator requesting the export. The email contains a web address from which the administrator must download the compressed data files.

Feature	Cloudfinder for Salesforce	Salesforce Data Export
Daily backup	Yes	No
Weekly full export	No	Yes
Unlimited retention	Yes	No
Restore	Yes	No

About us

eFolder is a leading supplier of cloud data protection, business continuity and cloud file sync solutions for MSPs, cloud service providers, system integrators, and VARs. The Cloudfinder platform delivers backup, search, and restore for broadly adopted business cloud applications.
